# WHAT IS APPLIED BEHAVIORAL ANALYSIS?

Applied Behavior Analysis is a scientific, behavioral management approach. By utilizing basic principles of behavior, special techniques and positive reinforcement, ABA therapy can bring about significant, measurable change. It's a way to shape and mold actions for effective communication and learning. It has been proven to improve attention, focus, social skills and memory, as well as decrease behaviors such as noncompliance, aggression, self-injury and stereotypy. ABA methods help kiddos replace hindering behaviors so they learn "what to do," not just "what not to do."

## 1 CENTER BASE THERAPY

Through Applied Behavior Analysis, we are given a unique opportunity to intensively work on adaptive living, communication and social skills in a structured and neutral environment.

## 2 HOME BASE THERAPY

In-home services may be more effective for some children who could benefit from the safe space their home provides. Services in their home environment can make it easier for some children to adapt to the newness of therapy, as well as decrease the amount of distractions while skill-building.

## PARENT TRAINING

As part of our dedication to your child, we design a personalized plan to help families adapt to the impact of their child's developmental condition by creating goals and building skills that are more impactful for the child and the family as a whole.

## SOCIAL SKILLS

ABA therapy emphasizes teaching and developing social skills for children with autism, utilizing a set of techniques and procedures based on the science of behavior analysis. This methodology is designed to improve a variety of skills related to social play, social language, and social intuition.
